Transition at the gap

We have transition at the gap when the global 2d unstable mode interacts (???) with the 3d modes.
 $d = 4, w = 19$

u, v, w, p spectrum (global stable mode frequency is dominant just after the gap)

Weakly unstable 2D mode, $d = 4$, $w = 18$ ($\Rightarrow$ 2d instability doesn't do anything)
