n-factors for shallow cases and BFS

- Nice and consistent curves across d of the BFS.
- for the gap cases, I might rerun some of the cases, because there is some variability that I cannot understand yet.
- You can see clearly that the black line has a stronger derivative than the BFS lines even far from the step. That's why I wanted to understand how exactly the neutral stability curve gets disturbed by the step or by the gap compared to the flat-plate case one.

n-factors for shallow cases and BFS

- Delta N prediction of jeff in the BFS compared to mine. Slope looks similar, but the values are slightly different.

n-factors for shallow cases and BFS

- Difference in the computations of Δn .
- If there is really a difference in the spatial evolution of the Δn -factors, then his approach looks more consistent.

n-factors for deep gap cases

- I ran gap cases with $d = 100$, $w = 5, 10, 15$.
